Search Notes

Using the molecular formula for structures 2b I could find no compound which matched the structure.. The specifications say that 2b illustrates the amide linkages formed per the reaction in figure 1 and are not what is being claimed.

I did a structure search which covered 3b and also any amide or amine beta to a nitrogen in a ring. There were 2498 polyamides found. Using ring identifiers for some of the nitrogen containing rings and a subset search for the polycyclic nitrogen containing ring this number was brought down to 223 polyamides with a nitrogen beta to the amide. Adding in preparation and the index term for polyamides I got 47 CA references from the 223 structures. Chemical Abstracts usually indexes polymers by the starting monomers rather than a structural repeating unit. Therefore all the answers will show a dicarboxylic acid and a diamine with a beta nitrogen in a heterocyclic ring as the starting monomers in a polymer.

As the applicant was NOT indexed with any registry numbers/structures I also did a text search of the concept and ended up with 6 more answers including the applicant.

If you have any questions please call me.

AB Method for treating a warm-blooded animal comprises (a) mixing the drug with mixed polymeric micelles comprising (i) poly(L-histidine)-poly(ethylene glycol) block copolymer and poly(L-lactic acid)-poly(ethylene glycol) block copolymer, (ii) poly(L-histidine)-poly(ethylene glycol) block copolymer-folate and poly(L-lactic acid)-poly(ethylene glycol) block copolymer, (iii) poly(L-histidine)-poly(ethylene glycol) block copolymer and poly(L-lactic acid)-poly(ethylene glycol) block copolymer-folate, or (iv) poly(L-histidine)-poly(ethylene glycol) block copolymer-folate and poly(L-lactic acid)-poly(ethylene glycol) block copolymer-folate, and (b) administering the drug-loaded mixed micelles to the animal wherein the drug-loaded mixed micelles are stable in blood and release the drug in acidic conditions. Poly(L-histidine) (MW 5,000)-poly(ethylene glycol) (MW 2,000) (polyHis5K-b-PEG2K) 20 mg in DMSO (20 mL) was dialyzed against borate buffer solution at pH 8.0 for 24 h and freeze-dried to give polymeric micelles powder (yield 90-93%) showing stable at pH 8.0 for 2 days, but soluble at pH 5.0 as no CMC can be detected.
